

State of Tariffs: July 11, 2025

Published: July 11, 2025

[Download the Data](#)

Key Takeaways

1

The Budget Lab (TBL) estimated the effects all US tariffs and foreign retaliation implemented in 2025 through July 11, including the announced 35% tariff on Canada. TBL will follow up with a sensitivity analysis of the announced 15-20% “reciprocal” tariff. TBL analyzed the July 10 tariff rates as if they stayed in effect in perpetuity.

2

Current Tariff Rate: Consumers face an overall average effective tariff rate of 18.7%, the highest since 1933. After consumption shifts, the average tariff rate will be 17.9%, the highest since 1934.

3

Overall Price Level & Distributional Effects: The price level from all 2025 tariffs rises by 1.9% in the short-run, the equivalent of an average per household income loss of \$2,500 in 2025\$. This assumes the Federal Reserve does not react to tariffs and so the real income adjustment comes primarily through prices rather than nominal incomes; if the Federal Reserve reacted, the adjustment could in part come in the form of lower nominal incomes. Annual pre-substitution losses for households at the bottom of the income distribution are \$1,300. The post-substitution price increase settles at 1.6%, a \$2,100 loss per household.

4

Commodity Prices: The 2025 tariffs disproportionately affect clothing and textiles, with consumers facing 39% higher shoe prices and 37% higher apparel prices in the short-run. Shoes and apparel prices both stay 18% higher in the long-run.

5

Real GDP Effects: US real GDP growth over 2025 is -0.8pp lower from all 2025 tariffs. In the long-run, the US economy is persistently -0.4% smaller, the equivalent of \$120 billion annually in 2024\$.

6

Labor Market Effects: The unemployment rate rises 0.4 percentage point by the end of 2025, and payroll employment is 578,000 lower.

7

Long-Run Sectoral GDP & Employment Effects: In the long-run, tariffs present a trade-off. US manufacturing output expands by 2.0%, but these gains are more than crowded out by other sectors: construction output contracts by 3.5% and agriculture declines by 1.0%.

8

Fiscal Effects: All tariffs to date in 2025 raise \$2.8 trillion over 2026-35, with \$434 billion in negative dynamic revenue effects, bringing dynamic revenues to \$2.3 trillion.

Changes Since the Last Report

Since the [July 10 report](#):

- On the evening of July 10, President Trump announced a 35% tariff on Canadian imports to go into effect August 1, up from the prior 25% rate.¹
- President Trump also announced that “all remaining countries” who had not received a letter on July 7 or July 9 would see a tariff rate of 15% or 20%. TBL has not incorporated this announcement into this report, but will follow-up next week with a sensitivity analysis of different possible rates.

TBL analyzes tariffs on a “real-time current policy” basis, where policy as it stands as of date certain is assumed to continue in perpetuity, even if framed as a temporary policy.

Current Tariff Policy as of July 11

U.S. Tariffs****

Retaliatory Tariffs

20% broad tariff on all Chinese imports (effective February 4; increased March 4)

[China 10%/15% list](#)
(announced February 4)

10% tariff on Canadian potash and energy (effective April 2)

[Canada 25% list](#)
(announced March 4)

25% tariff on all Mexican imports and other Canadian imports* (effective March 4)

[China 10%/15% list](#)
(announced March 4)

25% tariff on all automobiles, with an exemption for US content and a discount through April 2027 on parts tariffs for US-assembled autos** (effective April 3), reduced to 10% on the first 100K UK imports (announced May 8)

[Canada 25% list](#)
(announced March 13)

50% tariff on all steel and aluminum imports (effective March 12, raised May 30), 0% on the UK (announced May 8), extended to steel derivative products (effective June 23)

[China broad 125%](#), lowered to 0% for 90 days (announced April 4; increased April 11; lowered May 12)

50% tariff on copper imports (announced July 8, effective August 1).

UK reduction in ethanol tariff on the US to 0% (announced May 8).

Modified April 2 announcement: 10% minimum tariffs on all countries ex. China, Canada, & Mexico; 125% tariff on China lowered to 10% for 90 days on May 12 (effective April 9, modified April 9, 90-day duration)***. July 7 & 9 announcements (effective August 1).

US-Vietnam July 2 framework: 20% broad tariff, 40% tariff on goods transhipped from China.

* USMCA-compliant trade remains duty-free. TBL assumes that 48% of imports by value from Mexico are USMCA-compliant, while 50% of imports from Canada are compliant.

** TBL assumes that 40% of automobile content in imported motor vehicles from Canada and Mexico are of US origin. For the purposes of the auto tariff rebate, TBL assumes that 1/3 of imported autos are assembled in the US.

*** The tariffs announced on April 2 apply to most imported goods but exempt steel, aluminum, and autos—which have already been tariffed separately this year—as well as copper, pharmaceuticals, semiconductors, lumber, energy, and critical minerals. The Administration clarified the scope of the semiconductor exemption on April 13. TBL carved out these commodities in its analysis of the April 2 announcement but does stack tariffs on those commodities from earlier announcements where applicable.

**** [Executive Order 14289](#) prevents many tariffs from stacking with one another and establishes the stacking order for tariffs, with the Section 232 automobile tariffs being the highest priority.

Average effective tariff rate

The distinction between *pre-substitution* metrics (before consumers and businesses shift purchases in response to the tariffs) and *post-substitution* (after they shift) is a crucial one. One metric where the difference is meaningful is the average effective tariff rate.

Measured pre-substitution—assuming there are no shifts in the import shares of different countries—the 2025 tariffs to date (including the ones effective August 1) are the equivalent of a 16.3 percentage point increase in the US average effective tariff rate. That calculation assumes that, for example, the share of imports from China remains at 14%, where it was in 2024. This is the right way to think about the tariffs from the perspective of consumer welfare, since it reflects the full cost faced by consumers before they start making difficult spending choices. This increase would bring the overall US average effective tariff rate to 18.7%, the highest since 1933.

Post-substitution—after imports shift in response to the tariffs—the 2025 tariffs are a 15.5 percentage point increase in the US average effective tariff rate, which brings the overall US effective tariff rate to 17.9%, the highest since 1934.

The timing of the transition from “pre” to “post” substitution is highly uncertain. Some shifts are likely to happen quickly—within days or weeks—while others may take longer.²

Table 2. Average Effective US Tariff Rate, New 2025 Policy Through July 11

Pre- and post-substitution

	Effective Tariff	Import Share		Average Effective Tariff	
		Pre- Substitution	Post- Substitution	Pre- Substitution	Post- Substitution
China	28.0	14%	8%	3.8	2.2
Canada	14.0	13%	17%	1.8	2.3
Mexico	13.2	15%	19%	2.0	2.5
Rest of World	14.9	58%	57%	8.7	8.5
Total		100%	100%	16.3	15.5

Average aggregate price impact

The 2025 tariffs imply an increase in consumer prices of 1.9% in the short-run, assuming no policy reaction from the Federal Reserve and full passthrough of tariffs to consumers. As a result, TBL assumes the real income adjustment comes [primarily through prices rather than nominal incomes](#). If the Federal Reserve reacted, the adjustment could in part come in the form of lower nominal incomes. This is a pre-substitution number that captures consumer welfare effects. It is the equivalent of a short-run income loss³ of \$2,500 per household on average in 2025 dollars. The post-substitution price increase settles at 1.6%, a \$2,100 short-run loss per household.

US real GDP & labor market effects

All 2025 US tariffs plus foreign retaliation lower real GDP growth by -0.8pp over calendar year 2025 (Q4-Q4). The unemployment rate ends 2025 0.4 percentage point higher, and payroll employment is 578,000 lower that same quarter. The level of real GDP remains persistently -0.40% smaller in the long run, the equivalent of \$120 billion 2024\$ annually, while exports are -16.1% lower.

U.S. tariffs implemented through July 11
 Percentage point change against baseline

Chart: The Budget Lab • Source: S&P Global, GTAP v7, GTAP-RD, The Budget Lab analysis. • Created with [Datawrapper](#)

Long-run US sectoral output & employment effects

Tariffs shrink the overall size of the US economy in the long-run by 0.4%, but beneath aggregate GDP they also drive reallocation across US sectors. Long-run output in the manufacturing sector expands by 2.0% under the tariffs, with nonadvanced durable manufacturing output 3.8% larger and nondurable manufacturing 1.0% larger. However, advanced manufacturing is down by 2.8%. Moreover, the expansion of the overall manufacturing sector more than crowds out the rest of the economy: construction contracts by 3.5%, agriculture by 1.0%, and mining & extraction by 1.3%.

Global long-run real GDP effects

Canada has borne the brunt of the damage from US tariffs so far, with its long-run economy -2.1% smaller in real terms (reflecting both US tariffs and Canadian retaliation to date). China's economy is -0.2% smaller, about half as large as the hit to the US. The EU economy is 0.1 percentage point larger in the long-run, while the UK's is 0.2% bigger thanks in part to the benefits of US-UK trade deal.

Fiscal impact & historical context

The 2025 tariffs to date, were they to remain in place (and not expire after 90 days), would raise \$2.8 trillion over 2026-35 conventionally-scored (\$2.6 trillion over 2025-34).⁴ Given the negative output effects of the tariffs, there would be additional dynamic reductions in tax revenue as a result. Based on Congressional Budget Office rules-of-thumb, TBL estimates that these effects would total -\$434 billion over the decade (-\$394 billion over 2025-34), bringing total dynamic revenue to \$2.3 trillion over 2026-35 (\$2.2 trillion over 2025-34).

Short-run distributional impact

Tariffs are a regressive tax, especially in the short-run. This means that tariffs burden households at the bottom of the income ladder more than those at the top as a share of income. The regressivity is about the same when looking at all 2025 tariffs: the short-run burden on the 1st decile is more than 3x that of the top decile (-3.5% versus -1.0%). The average annual cost to households in the 1st and top decile rise to \$1,300 and \$5,100 respectively in 2025\$. The median cost is \$2,200 per household.

Figure 6. Short-Run Distributional Impact of 2025 Tariffs to Date

Through July 11

Percentage points of disposable income by household income decile

Chart: The Budget Lab • Source: GTAP v7, Census, BLS, BEA, The Budget Lab analysis. • Created with [Datawrapper](#)

Constant 2025\$ of Average Disposable Income per Household

Tariffs are more distributionally-ambiguous in the longer-run. Tariffs reduce both labor income and above-normal returns to capital, or rents. We assume that owners of capital hold rents rather than consume them in the short-run, but do consume them over their lifecycle in the long-run. The implication is that the tariff burden is more regressive in the short-run and more evenly-distributed across households in the long-run

Commodity price effects

The charts below show how the 1.8% price level increase from the 2025 tariffs to date would look across individual commodities in the short-run (pre-substitution), as well as the 1.5% long-run price increase (post-substitution).

Some high level takeaways:

- Consumers face high increases in clothing and textile prices in the short-run: prices increase 39% for leather products (shoes and hand bags), 38% for apparel, and 19% for textiles. After substitution and global supply shifts in the long-run, prices remain 19%, 18%, and 10% higher, respectively.
- Food prices rise 3.3% in the short-run and stay 2.9% higher in the long-run. Fresh produce is initially 6.8% more expensive while stabilizing at 3.6% higher.
- Motor vehicle prices rise 13.8% in the short-run and 10.4% in the long-run, the equivalent of an additional \$6,600 and \$5,000 respectively to the price of an average 2024 new car.

Footnotes

1. TBL assumes the new 35% Canadian rate replaces the 25% rate and has all of the same exemptions and stacking principles as prior, e.g. the lower 10% rate on Canadian potash & energy remains, as does the stacking order laid out in Executive Order 14289.
2. TBL assumes throughout its tariff analysis that the transition to longer-run GTAP equilibria occurs after three years.

3. TBL defines “income” as CBO-concept post-tax-and-transfer income. “Short-run” refers to the effect over the next couple of years; TBL proxies for this definition by using CBO projections of the distribution of income in 2027, expressed in 2025 dollars.
4. TBL employs a “relaxed conventional” assumption for the retaliation scenario, whereby foreign income is permitted to fall but US income remains fixed.
